

ABSTRACT:

The invention proposes an electronic apparatus which comprises two parts (12, 14) which are mutually movable and can be electrically interconnected, so that at least one of them transmits information to the other so as to control functions of the electronic apparatus.

The two parts (12, 14) are mounted mutually sliding between a retracted
5 position, in which the electronic apparatus permits to carry out the first group of functions, and an open position, in which the electronic apparatus permits to carry out a second group of functions.
